0%-3% pays before time. Very excellent

3% - 4% pays on time: excellent

4% - 100% pays but delays: Good

100%- 1181%: does not stick to agreement: Bad

1181% and above not pay at all

I used number of days in a calender. Let me give and example with January-31 and February-27 days

Let's say Simon consents on the system that he will pay on the 1st. And then pays straight on the day: that will be 1/31 = 0.03 x 100= 3.2 and that is excellent

But if he paid before the 1st. Then he would automatically fall under very excellent which is between 0-3% on the system.

Let's say he delays by 5 days: it would be 5/31 = 16% which falls under good

Or if he paid on the 31/31 it would be 100% which would mean good...he paid within a month.

Same Simon pays the 1st of the following month: that would be 32/31 = 103% falls under bad credit.

If he pays after 366/31= 1181% considered not to pay at all.

Feb would be the same : 1/27= 4% which

is excellent and it goes the same way. So if someone borrowed in feb then days would add against February to give us the scoring. E.g 30 days /27 says.. already bad scoring
